Definitions

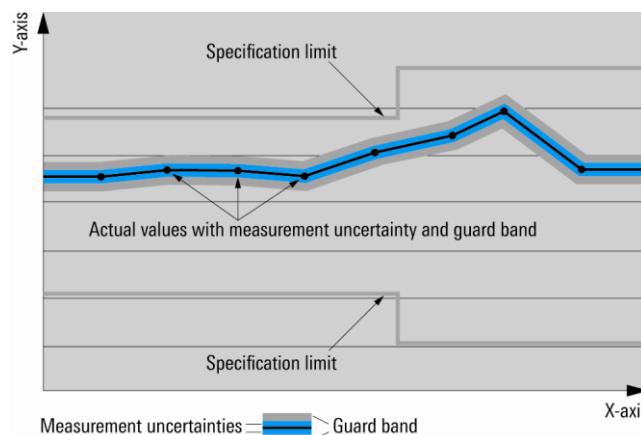

General

Product data applies under the following conditions:

- Three hours storage at ambient temperature followed by 30 minutes warm-up operation
- Specified environmental conditions met
- Recommended calibration interval adhered to
- All internal automatic adjustments performed, if applicable

Specifications with limits

Represent warranted product performance by means of a range of values for the specified parameter. These specifications are marked with limiting symbols such as $<$, \leq , $>$, \geq , \pm , or descriptions such as maximum, limit of, minimum. Compliance is ensured by testing or is derived from the design. Test limits are narrowed by guard bands to take into account measurement uncertainties, drift and aging, if applicable.

Non-traceable specifications with limits (n. trc.)

Represent product performance that is specified and tested as described under "Specifications with limits" above. However, product performance in this case cannot be warranted due to the lack of measuring equipment traceable to national metrology standards. In this case, measurements are referenced to standards used in the Rohde & Schwarz laboratories.

Specifications without limits

Represent warranted product performance for the specified parameter. These specifications are not specially marked and represent values with no or negligible deviations from the given value (e.g. dimensions or resolution of a setting parameter). Compliance is ensured by design.

Typical data (typ.)

Characterizes product performance by means of representative information for the given parameter. When marked with $<$, $>$ or as a range, it represents the performance met by approximately 80 % of the instruments at production time. Otherwise, it represents the mean value.

Nominal values (nom.)

Characterize product performance by means of a representative value for the given parameter (e.g. nominal impedance). In contrast to typical data, a statistical evaluation does not take place and the parameter is not tested during production.

Measured values (meas.)

Characterize expected product performance by means of measurement results gained from individual samples.

Uncertainties

Represent limits of measurement uncertainty for a given measurand. Uncertainty is defined with a coverage factor of 2 and has been calculated in line with the rules of the Guide to the Expression of Uncertainty in Measurement (GUM), taking into account environmental conditions, aging, wear and tear.

Device settings and GUI parameters are indicated as follows: "parameter: value".

Typical data as well as nominal and measured values are not warranted by Rohde & Schwarz.

In line with the 3GPP/3GPP2 standard, chip rates are specified in Mcps (million chips per second), whereas bit rates and symbol rates are specified in Gbps (billion bits per second), Mbps (million bits per second), kbps (thousand bits per second), Msps (million symbols per second) or ksps (thousand symbols per second), and sample rates are specified in Msample/s (million samples per second). Gbps, Mcps, Mbps, Msps, kbps, ksps and Msample/s are not SI units.

Specifications

The specifications of the R&S®VSE-K10/R&S®FSx-K10 GSM measurements are based on the data sheet specifications of the R&S®FSW, R&S®FSVA3000, R&S®FSV3000, R&S®FSVA, R&S®FSV and R&S®FPS signal and spectrum analyzers in the default operating mode (signal and spectrum analyzer mode). They have not been checked separately and are not verified during instrument calibration. Measurement uncertainties are given as 95 % confidence intervals at a center frequency of 935 MHz. The specified level measurement errors do not take into account systematic errors due to reduced signal-to-noise ratio (SNR).

General remarks

This data sheet covers the R&S®FSW-K10, R&S®FSV3-K10, R&S®FSV-K10, R&S®FPS-K10 and the R&S®VSE-K10.

The R&S®FSW-K10, R&S®FSV3-K10, R&S®FSV-K10 and R&S®FPS-K10 are summarized with the term R&S®FSx-K10.

The R&S®FSx-K10 runs on the device itself.

The R&S®VSE-K10 runs on a PC that can be connected to the following analyzers: R&S®FSW, R&S®FSVA, R&S®FSV, R&S®FPS and for R&S®VSE; firmware version 1.62 or higher also to R&S®FSVA3000 and R&S®FSV3000.

If not stated otherwise, the data sheet values are device-specific, e.g. the same value applies to the R&S®FSW-K10 and the R&S®VSE-K10 with connected R&S®FSW.

For feature tables, the following convention applies:

•	Feature always supported, i.e. with the R&S®VSE-K10 connected to the device and with the corresponding R&S®FSx-K10 option when running directly on the device.
• (VSE)	Feature supported only with the R&S®VSE-K10 connected to the device. Not with the R&S®FSx-K10 option when running directly on the device.
• (FSx-K10)	Feature supported only when running directly on the device with the R&S®FSx-K10 option. Not supported in the R&S®VSE-K10.
-	Feature not supported with this device.

Frequency setting	frequency band single carrier multicarrier ⁹				
	frequency and ARFCN up to 16 carriers frequencies carrier allocation: • contiguous • noncontiguous ¹⁰				

¹ R&S®FSW/FSV3/FPS-K10: MEAS hardkey switches between multicarrier wideband noise measurement and single carrier I/Q based measurement. R&S®FSV-K10: Softkeys switch between single carrier I/Q based measurements and the wide modulation spectrum measurement.

² Modulation spectrum measurements are covered by the MCWN (R&S®FSW/FSV3-K10/FPS-K10) or the I/Q measurement (R&S®FSW/FSV3/FPS/VSE-K10) mode. No separate measurement mode available.

³ Measurement in line with 3GPP TS 51.021, chapter 6.12: Wideband noise and intra-BSS intermodulation attenuation in multicarrier operation.

⁴ Gated zero span modulation spectrum measurements for offset frequencies up to 6 MHz.

⁵ Restricted dynamic range, IF overload, IF power trigger and auto level functionality depending on carrier frequency and bandwidth at carrier frequencies < 90 MHz.

⁶ Only with R&S®FSW-B17 option.

⁷ Only with R&S®FSV-B17 option.

⁸ Only with R&S®FSW-B71 option.

⁹ R&S®FSV-K10: Only up to 12 active carriers. Configuration of carrier allocation and carrier frequencies not supported.

¹⁰ Noncontiguous frequency allocation is defined as an allocation where two sub-blocks are separated by at least 5 MHz (cf. 3GPP TS 51.021, chapter 4.10.10. multicarrier BTS).

Magnitude error	graphical results: minimum/average/maximum/current	magnitude error versus time
Modulation spectrum graph	graphical results: current/average	power versus frequency limit check
Modulation spectrum table	numerical results: table	power versus offset frequency offset frequencies up to 6 MHz ¹⁹ limit check
Transient spectrum graph	graphical results: current/maximum	power versus frequency limit check
Transient spectrum table	numerical results: table	power versus offset frequency limit check
Trigger to sync graph	graphical results: histogram/PDF ²⁰ of average	probability versus trigger to sync time
Trigger to sync table	numerical results: table	trigger to sync time: minimum/average/maximum/current/standard deviation

¹⁶ R&S®FSV-K10 supports a multiple measurement mode for fast and simultaneous I/Q based measurements of power versus time, modulation accuracy, EVM/phase error/magnitude error versus time, modulation spectrum and transient spectrum. With R&S®FSW/FSV3/FPS/VSE-K10, all I/Q based measurements can be setup and measured simultaneously.

¹⁷ For availability of this feature, see Supported measurements.

¹⁸ R&S®FSV-K10 does not support arbitrary zooming. Zooming can be achieved by means of the dedicated rising/falling/rising and falling/top high resolution views.

¹⁹ R&S®FSV-K10: only up to 1.8 MHz.

²⁰ Probability density function.

Multicarrier wideband noise measurements (MCWN) ^{3, 17}		
Spectrum graph	graphical results: average trace, 100 kHz and 300 kHz RBW combined, narrowband noise bars, carrier power bars, limit line	power versus frequency wideband noise intermodulation products narrowband noise carrier powers limit check, check maximum number of limit exceptions
Carrier power table	numerical results: table	power level per carrier, 30 kHz, 100 kHz, 300 kHz reference power per carrier, reference carrier indication
Outer intermodulation table Inner intermodulation table ²¹	numerical results: table	power at intermodulation product frequency relative to closest outermost carrier intermodulation product order (up to 5th) limit check
Outer wideband table Inner wideband table ²¹	numerical results: table	worst distance to limit per limit line segment wideband noise power, absolute and relative frequency, absolute and relative to closest outermost carrier limit check
Outer narrowband table, Inner narrowband table ²¹	numerical results: table	narrowband noise power, absolute and relative frequency, absolute and relative to closest outermost carrier limit check
Wide modulation spectrum measurements ¹⁷		
Wide modulation spectrum	numerical results: table	power versus offset frequency gated zero span measurement offset frequencies up to 6 MHz limit check

²¹ Only available for noncontiguous carrier allocation of a multicarrier BTS.

Measurement uncertainty (nominal)

Measurement uncertainties only apply for these signal and spectrum analyzer models:

- R&S®FSW8, R&S®FSW13, R&S®FSW26
- R&S®FSVA3004, R&S®FSVA3007 and R&S®FSVA3013, R&S®FSV3004, R&S®FSV3007, R&S®FSV3013
- R&S®FSVA4, R&S®FSVA7, R&S®FSVA13, R&S®FSV4, R&S®FSV7, R&S®FSV13, R&S®FSV30
- R&S®FPS4, R&S®FPS7, R&S®FPS13, R&S®FPS30
