2 Welcome to the DVB-H/T and DVB-S2/S2X Options

The R&S SMBV-K52/-K116 are firmware applications that add functionality to generate signals in accordance with:

- The DVB-H/T (Digital Video Broadcasting - Transmission System for Handheld Terminals) standard
- The standards describing the second-generation DVB system for satellite communication DVB-S2 and the optional extension DVB-S2X.

DVB (digital video broadcasting) provides a communications infrastructure for powerful transmission of MPEG-2-based data. Besides satellite-based (DVB-S), terrestrial (DVB-T) and cable-bound (DVB-C) transmission schemes, the version (DVB-H) is for portable/handheld terminals. DVB-H is an extension to DVB and is compatible with the basic concept of the standard. The extensions bring advantages that are especially important for portable devices: low power consumption, small hardware and robustness against fading effects.

The DVB-S2 standard is introduced as successor the DVB-S for the transmission of digital video broadcasts over satellite links. The DVB-S2X standard is an optional extension of the DVB-S2 standard. DVB-S2X allows an efficiency gain of up to 51% compared to DVB-S2. With that, higher data rates can be transported over the same satellite transponder capacity.

The main advantages of the DVB-H / DVB-T digital standard option **R&S SMBV-K52** are:

- Possibility to test both mobile communications standards (such as WCDMA 3GPP FDD, TD-SCDMA, GSM/EDGE) and DVB-H or DVB-T using only one signal generator
- Simple generation of standard-compliant DVB-H or DVB-T signals

Option **R&S SMBV-K116** extends the functionalities with the following key features:

- Fully encoded DVB-S2 and DVB-S2X signal generation
- Support of the stream types: transport stream (TS), generic packetized (GP), generic continuos (GC), generic stream encapsulated high efficiency mode (GSE-HEM)
- Signal generation form arbitrary data sources and TS or GSE files
- Channel coding according to the standard, incl. scrambling, interleaving, outer code (BCH), inner code (LDPC) with varying code rates from 1/4 to 31/45
- Support of all specified Walsh-Hadamard sequences for VL-SNR (very low signal to noise ratio) mode
- Configurable header information, incl. baseband (BB) header, VL-SNR header, TS header, GSE header
- Supported modulation schemes:
 - For DVB-S2: QPSK, 8PSK, 16APSK, 32APSK
 - For DVB-S2X: QPSK, 8APSK, 8PSK, 16APSK, 32APSK, 64APSK, 128APSK, 256APSK

- For VL-SNR: QPSK, pi/2 BPSK
- Pilot insertion and configuration
- Signals suitable for testing of satellite transponders, components and ground modems

This operating manual contains a description of the functionality that the application provides, including remote control operation.

All functions not discussed in this manual are the same as in the base unit and are described in the R&S SMBV operating manual. The latest version is available at:

www.rohde-schwarz.com/manual/SMBV100A

2.1 Accessing the DVB Dialog

To open the dialog with DVB settings

- In the block diagram of the R&S SMBV, select "Baseband > DVB".
A dialog box opens that displays the provided general settings.

The signal generation is not started immediately. To start signal generation with the default settings, select "State > On".

2.2 Scope

Tasks (in manual or remote operation) that are also performed in the base unit in the same way are not described here.

In particular, it includes:

- Managing settings and data lists, like storing and loading settings, creating and accessing data lists, or accessing files in a particular directory.
- Information on regular trigger, marker and clock signals and filter settings, if appropriate.
- General instrument configuration, such as configuring networks and remote operation
- Using the common status registers

For a description of such tasks, see the R&S SMBV operating manual.

2.3 Notes on Screenshots

When describing the functions of the product, we use sample screenshots. These screenshots are meant to illustrate as much as possible of the provided functions and possible interdependencies between parameters. The shown values may not represent realistic usage scenarios.

The screenshots usually show a fully equipped product, that is: with all options installed. Thus, some functions shown in the screenshots may not be available in your particular product configuration.

3 About the DVB Options

The digital video broadcasting (DVB) suite of standards described methods for data and video signals transmission through different medium including cable, terrestrial, mobile and satellite.

This section provides brief background information on basic terms and principles used in the DVB standards.

3.1 About the DVB-H/T

The Digital Video Broadcasting - Handheld (DVB-H) standard is based on the earlier standard DVB-T, which is used for terrestrial digital broadcasting.

The block diagram on [Figure 3-1](#) shows the components of the DVB-H transmission system.

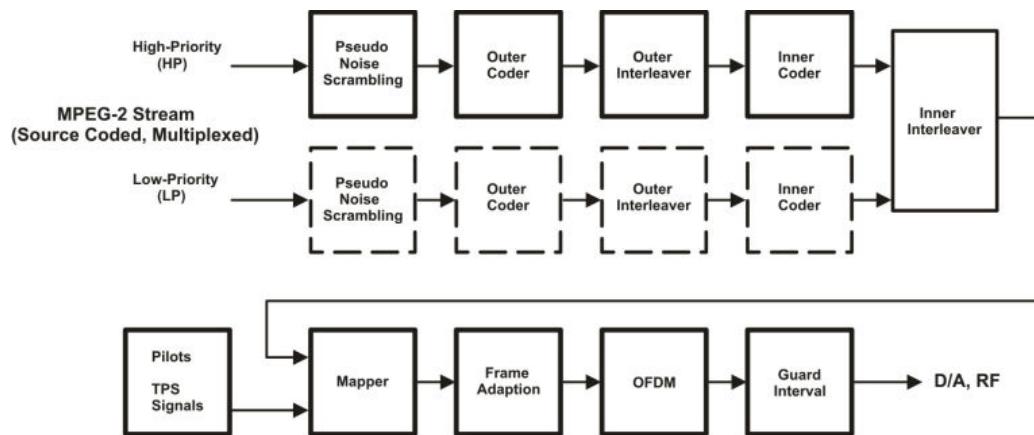

Figure 3-1: Components of the transmission system DVB-H

DVB-H provides features to meet the specific requirements for handheld, mobile terminals such as:

- Power off some part of the reception chain to increase the battery duration
- Ease access to the services when receivers switching to the next cell
- Mitigate the effects of man-made noise and severe mobile multipath channels on the receiving capabilities
- Offer sufficient flexibility and scalability to allow reception of services at various speeds
- Offer the flexibility to be used in various transmission bands and channel bandwidths

The basic technical extensions that make it possible to receive digital video broadcasting services on handheld terminals are:

- 4K mode and in-depth interleavers
- Time-slicing

- Forward error correction for multiprotocol encapsulated data (MPE-FEC)

3.2 About the DVB-S2/S2X

Figure 3-2 illustrates schematically the components of the DVB-S2/S2X transmission systems. The block diagram is a simplified version of the DVB-S2 system specified in the DVB standard.

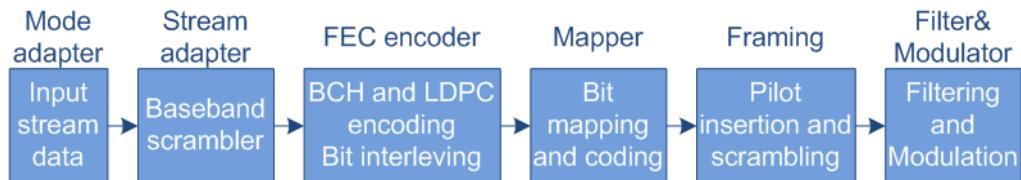

Figure 3-2: Components of the transmission system DVB-S2/S2X

FEC = Forward error correction

BCH = Bose-Chaudhuri-Hocquenghem multiple error correction binary block codes

LDPC = Low-density parity check

The main improvements of the second-generation DVB system for satellites (DVB-S2) compared to DVB-S are:

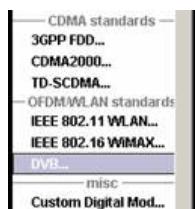

- Input stream adapter, suitable for operation with single and multiple input streams and different formats (packetized or continuous)
- FEC system based on LDPC codes concatenated with BCH codes
- Range of code rates (from 1/4 up to 9/10);
Four constellations with different spectrum efficiency and optimized for operation over non-linear transponders
- Three predefined spectrum shapes with rolloff factors 0.35, 0.25 and 0.20
- Adaptive coding and modulation (ACM) functionality for optimized channel coding and modulation on a frame-by-frame basis.

The DVB-S2X is an extension to the DVB-S2 standard. The DVB-S2X reuses the DVB-S2 system architecture and improves it with the following:

- Adds finer MODCOD steps, higher-order modulations and complex constellations
- Three new sharper spectrum shapes
- Defines the VL-SNR (low signal to noise ratio) mode for example for mobile applications
- Optional periodic pilots and physical layer scrambles for easy synchronization
- GSE-Lite compliant signaling and streaming
- Adds a high-efficiency mode (GSE-HEM) intended to transport GSE and GSE-Lite packets

The name of the file is specified in the File name entry field, the directory selected in the save into field. The file is saved by pressing the "Save" button.

The "Fast Save" checkbox determines whether the instrument performs an absolute or a differential storing of the settings. Enable this function to accelerate the saving process by saving only the settings with values different to the default ones. "Fast Save" is not affected by the "Preset" function.

"File Manager" Calls the "File Manager".

The dialog is used to copy, delete, and rename files and to create new directories.

Remote command:

[\[:SOURce<hw>\]:BB:DVB:DVB\\$|DVBX:BSCRambler\[:STATe\] on page 78](#)

Outer Coder

The code rate is calculated as *code rate* = m/n , where:

- m is the number of incoming bits
- n are the number of bits in the coded output symbol

A wide range of code rates is specified. The available code rates depend on the selected "Modulation", modulation coder ("MODCOD") and if "VL-SNR Mode" is used or not.

SF

For "DVB Standard > DVB-S2X" with enabled [VL-SNR Mode](#) and "Code Type > Short", sets the spreading factor.

Per default, the VL-SNR mode uses "Modulation > pi/2 BPSK" and "SF = 2". The spreading factor of 2 means that encoded bits are repeated twice before they are mapped into the constellation.

Remote command:

[\[:SOURce<hw>\]:BB:DVB:DVB\\$|DVBX:SFACTOR on page 79](#)

Code Type

Selects the FEC code type.

"Code Type > Medium" is available if "VL-SNR Mode > On".

In VL-SNR mode, the required Walsh-Hadamard sequence is selected automatically as function of the parameters **MODCOD** and "Code Type".

Suitable modulation schemes are selected automatically to fit the selected **MODCOD**.

The DVB-S2/S2X standards specify different modulation schemes, ranging in power and spectrum efficiency. The available values depend on the used "DVB Standard", the selected "MODCOD", "Code Type" and if "VL-SNR Mode" is used or not.

- "DVB Standard > DVB-S2"

- "DVB Standard > DVB-S2X" with "VL-SNR Mode > On"
QPSK, pi/2 BPSK

The constellation diagram illustrates the selected modulation and coding.

Example:

"Modulation = (16 + 16 + 16 + 16) APSK" is an APSK modulation with 64 constellation points, distributed on 4 concentric rings with 16 constellation point each.

4.8 Filter/Clipping Settings

Access:

- ▶ Select "Main dialog > Filter/Clipping Settings".

The dialog comprises the settings, necessary to configure the baseband filter and to enable clipping.

4.8.1 Filter Settings

Provided are the following settings:

Settings:

Filter	37
Rolloff Range	38
Rolloff Factor or BxT	38
Cutoff Frequency Shift	38
Cutoff Frequency Factor	39
Symbol/Sample Rate Variation	39

Filter

Selects the baseband filter.

The DVB-S2/S2X standards use the predefined root cosine (RRC) filter to shape the baseband signal spectrum.

Remote command:

[\[:SOURce<hw>\] :BB:DVB:FILTer:TYPE](#) on page 56

Rolloff Range

(requires option R&S SMBV-K116)

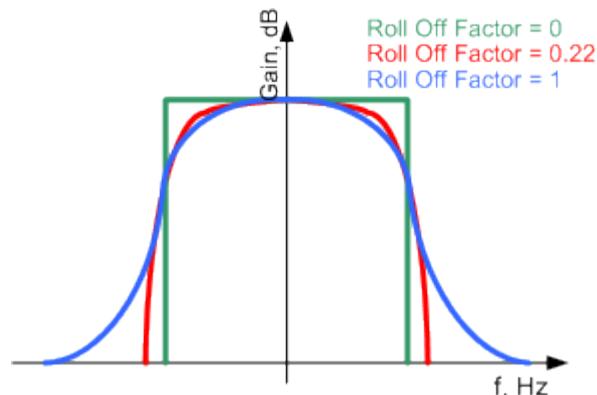

For "DVB Standard > DVB-S2X", selects whether the high or the low filter roll-off range is used, see [Table 4-2](#).

Remote command:

`[:SOURce<hw>] :BB:DVB:FILTer:RORange` on page 57**Rolloff Factor or BxT**

Sets the filter parameter.

The rolloff factor affects the steepness of the filter slopes. A "Rolloff Factor = 0" results in the steepest slopes; values near to 1 make the slopes more flat.

*Figure 4-1: Example of the frequency response of a filter with different rolloff factors*

For "DVB Standard > DVB-S2/S2X", the rolloff factors are predefined.

Table 4-2: Predefined sets of spectrum shapes

"DVB Standard"	"Rolloff Range"	"Rolloff Factor"
"DVB-S2"	-	0.35, 0.25, 0.20
"DVB-S2X"	Low	0.15, 0.1, 0.05
	High	0.35, 0.25, 0.20

Remote command:

`[:SOURce<hw>] :BB:DVB:FILTer:PARAmeter:APCO25` on page 56
`[:SOURce<hw>] :BB:DVB:FILTer:PARAmeter:COSine` on page 56
`[:SOURce<hw>] :BB:DVB:FILTer:PARAmeter:GAUSS` on page 57
`[:SOURce<hw>] :BB:DVB:FILTer:PARAmeter:PGAuss` on page 57
`[:SOURce<hw>] :BB:DVB:FILTer:PARAmeter:RCOSine` on page 57
`[:SOURce<hw>] :BB:DVB:FILTer:PARAmeter:SPHase` on page 57
`[:SOURce<hw>] :BB:DVB:FILTer:ROFactor` on page 57

Cutoff Frequency Shift

The cutoff frequency is a filter characteristic that defines the frequency at the 3 dB down point. The "Cut Off Frequency Shift" affects this frequency in the way that the fil-

ter flanks are "moved" and the transition band increases by "Cut Off Frequency Shift"**"Sample Rate".

- A "Cut Off Frequency Shift" = -1 results in a very narrow-band filter
- Increasing the value up to 1 makes the filter more broad-band
- By "Cut Off Frequency Shift" = 0, the -3 dB point is at the frequency determined by the half of the selected "Sample Rate".

Tip: Use this parameter to adjust the cutoff frequency and reach spectrum mask requirements.

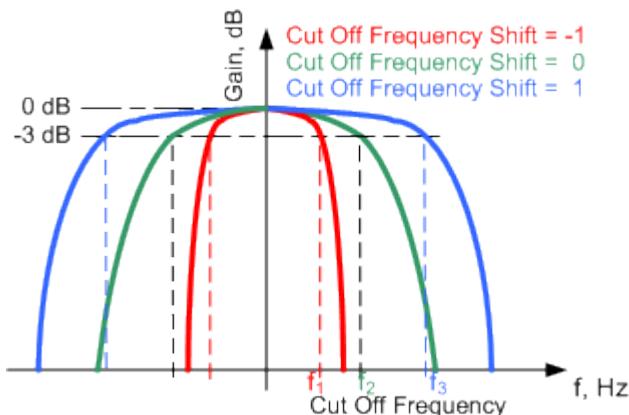

Figure 4-2: Example of the frequency response of a filter with different cutoff frequency shift

Remote command:

[\[:SOURce<hw>\]:BB:DVB:FILTer:PARAmeter:COSine:COFS](#) on page 56

Cutoff Frequency Factor

Sets the value for the cutoff frequency factor. The cutoff frequency of the filter can be adjusted to reach spectrum mask requirements.

[\[:SOURce<hw>\]:BB:DVB:FILTer:PARAmeter:LPASSEVM](#) on page 57

Symbol/Sample Rate Variation

Sets the symbol/sample rate of the signal. A variation of this parameter only affects the ARB clock rate; all other signal parameters remain unchanged.

Remote command:

[\[:SOURce<hw>\]:BB:DVB:SRATE:VARiation](#) on page 58

4.8.2 Clipping Settings

DVB signals can have a high crest factor (~ 11dBm) because of high amplitude variations that come along with OFDM signals having a noise-like spectrum. High crest factors entail two basic problems:

- The nonlinearity of the power amplifier (compression) causes intermodulation which expands the spectrum (spectral regrowth).

- Since the level in the D/A converter is relative to the maximum value, the average value is converted with a relatively low resolution. This results in a high quantization noise.

Both effects increase the adjacent-channel power.

Since clipping the signal not only changes the peak value but also the average value, the effect on the crest factor is unpredictable.

The following pictures demonstrate the effect of clipping with vector mode ($|i+jq|$), using the default signal configuration with a PN23 input sequence.

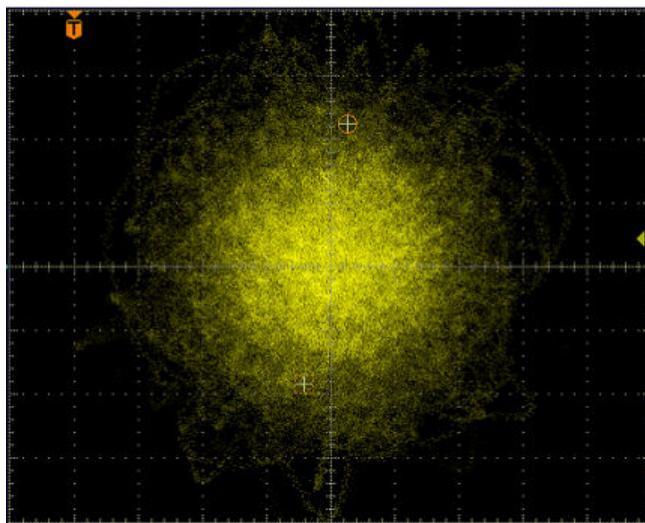

Figure 4-3: Constellation diagram of the signal without clipping, shows the level mapping

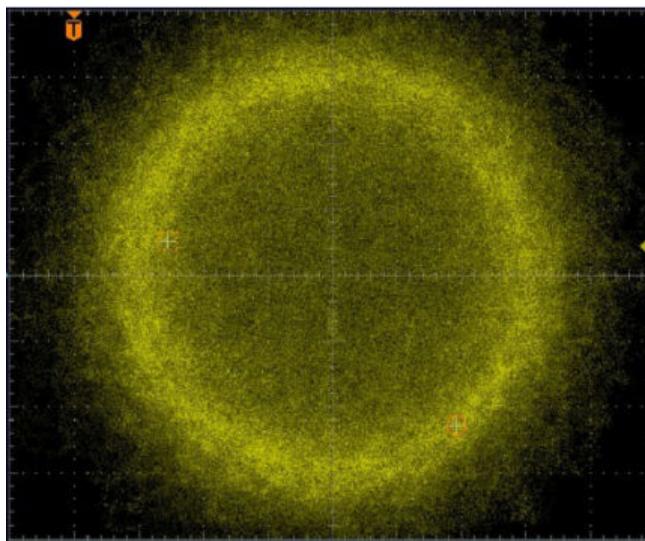

Figure 4-4: Constellation diagram with clipping level 10 %, vector mode ($|i+jq|$)

Settings:

Clipping State.....	41
Clipping Level.....	41
Clipping Mode.....	41

Clipping State

Switches baseband clipping on and off.

Baseband clipping is a simple and effective way of reducing the crest factor of the signal. Since clipping is done before filtering, the procedure does not influence the spectrum. The EVM however increases.

Remote command:

[:SOURce<hw>] :BB:DVB:CLIPping:STATE on page 59

Clipping Level

Sets the limit for clipping.

This value indicates at what point the signal is clipped. It is specified as a percentage, relative to the highest level. 100% indicates that clipping does not take place.

Remote command:

[:SOURce<hw>] :BB:DVB:CLIPping:LEVel on page 58

Clipping Mode

Selects the clipping method. The dialog displays a graphical illustration on how this two methods work.

- "Vector | i + jq |"
The limit is related to the amplitude $| i + q |$. The I and Q components are mapped together, the angle is retained.
- "Scalar | i | , | q |"
The limit is related to the absolute maximum of all the I and Q values $| i | + | q |$. The I and Q components are mapped separately, the angle changes.

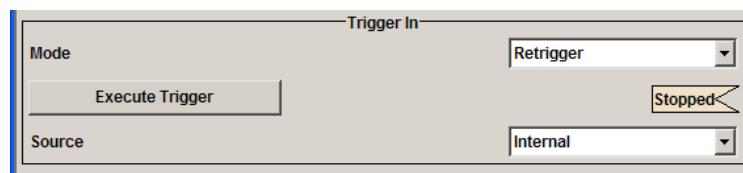

Remote command:

[:SOURce<hw>] :BB:DVB:CLIPping:MODE on page 59

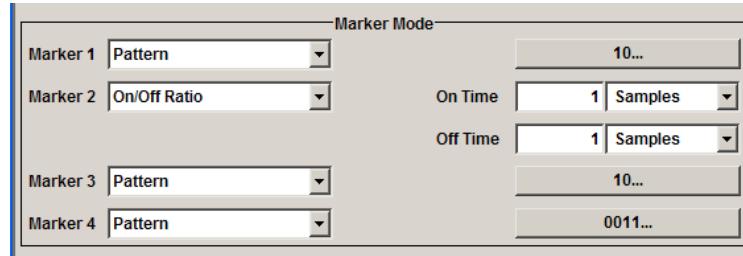

4.9 Trigger/Marker/Clock Settings

- To access this dialog, select "Main Menu > Trigger/Marker".

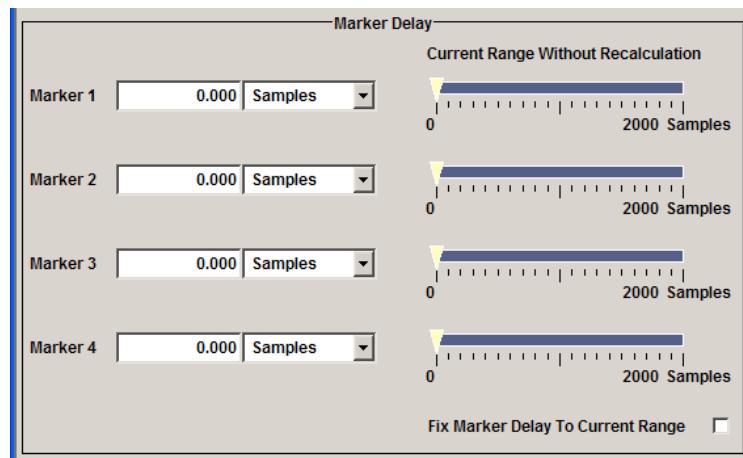

The "Trigger In" section is where the trigger for the signal is set. Various parameters will be provided for the settings, depending on which trigger source - internal or external - is selected. The current status of signal generation ("Running" or "Stopped") is indicated for all trigger modes.

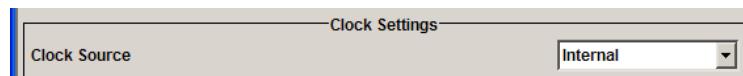

The "Marker Mode" section is where the marker signals at the "Marker" output connectors are configured.

The "Marker Delay" section is where a marker signal delay can be defined, either without restriction or restricted to the dynamic section, i.e., the section in which it is possible to make settings without restarting signal and marker generation.

The "Clock Settings" section is where the clock source is selected and - in the case of an external source - the clock type.

The buttons in the last section lead to submenu for general trigger, clock and mapping settings.

4.9.1 Trigger Settings

The "Trigger In" section is where the trigger for the signal is set. Various parameters will be provided for the settings, depending on which trigger source - internal or external - is selected. The current status of signal generation ("Running" or "Stopped") is indicated for all trigger modes.

Trigger Mode

Selects trigger mode, i.e. determines the effect of a trigger event on the signal generation.

- "Auto"
The signal is generated continuously.
- "Retrigger"
The signal is generated continuously. A trigger event (internal or external) causes a restart.
- "Armed Auto"
The signal is generated only when a trigger event occurs. Then the signal is generated continuously.
An "Arm" stops the signal generation. A subsequent trigger event (internal with or external) causes a restart.
- "Armed Retrigger"
The signal is generated only when a trigger event occurs. Then the signal is generated continuously. Every subsequent trigger event causes a restart.
An "Arm" stops signal generation. A subsequent trigger event (internal with or external) causes a restart.
- "Single"
The signal is generated only when a trigger event occurs. Then the signal is generated once to the length specified at "Signal Duration".
Every subsequent trigger event (internal or external) causes a restart.

Remote command:

[\[:SOURce<hw>\]:BB:DVB\[:TRIGger\]:SEQUence](#) on page 63

Signal Duration Unit

Defines the unit for the entry of the length of the signal sequence to be output in the "Single" trigger mode.

Remote command:

[\[:SOURce<hw>\]:BB:DVB:TRIGger:SLUnit](#) on page 61

Signal Duration

Defines the length of the signal sequence to be output in the "Single" trigger mode.

It is possible to output deliberately just part of the signal, an exact sequence of the signal, or a defined number of repetitions of the signal.

Remote command:

[\[:SOURce<hw>\]:BB:DVB:TRIGger:SLEnGth](#) on page 61

Running/Stopped

With enabled modulation, displays the status of signal generation for all trigger modes.

- "Running"

The signal is generated; a trigger was (internally or externally) initiated in triggered mode.

- "Stopped"

The signal is not generated and the instrument waits for a trigger event.

Remote command:

[\[:SOURce<hw>\]:BB:DVB:TRIGger:RMODE?](#) on page 61

Arm

Stops signal generation manually. This button appears only with "Running" signal generation in the "Armed_Auto" and "Armed_Retigger" trigger modes.

Remote command:

[\[:SOURce<hw>\]:BB:DVB:TRIGger:ARM:EXECute](#) on page 60

Execute Trigger

Executes the trigger manually. A manual trigger can be executed only if an internal trigger source and a trigger mode other than "Auto" have been selected.

Remote command:

[\[:SOURce<hw>\]:BB:DVB:TRIGger:EXECute](#) on page 61

Trigger Source

Selects trigger source. This setting is effective when a trigger mode other than "Auto" has been selected.

- "Internal"

The trigger event is executed by "Execute Trigger".

- "External"

The trigger event is the active edge of an external trigger signal, supplied at the TRIGGER connector.

Use the "Global Trigger/Clock Settings" dialog to define the polarity, the trigger threshold and the input impedance of the trigger signal.

Remote command:

[\[:SOURce<hw>\]:BB:DVB:TRIGger:SOURce](#) on page 62

Sync. Output to External Trigger

(enabled for Trigger Source External)

Enables/disables output of the signal synchronous to the external trigger event.

For R&S SMBV instruments:

For or two or more R&S SMBVs configured to work in a master-slave mode for synchronous signal generation, configure this parameter depending on the provided system trigger event and the properties of the output signal. See the table below for an overview of the required settings.

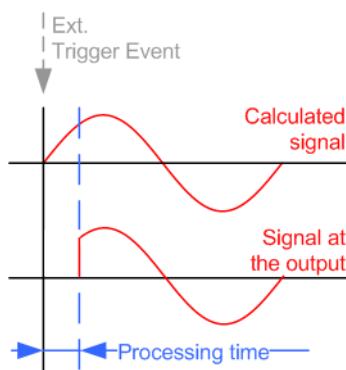

Table 4-3: Typical Applications

System Trigger	Application	"Sync. Output to External Trigger"
Common External Trigger event for the master and the slave instruments	All instruments are synchronous to the external trigger event	ON
	All instruments are synchronous among themselves but starting the signal from first symbol is more important than synchronicity with external trigger event	OFF
Internal trigger signal of the master R&S SMBV for the slave instruments	All instruments are synchronous among themselves	OFF

"On"

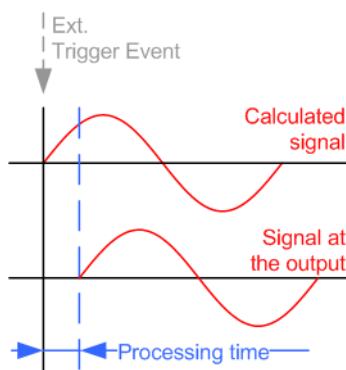

Corresponds to the default state of this parameter.

The signal calculation starts simultaneously with the external trigger event but because of the instrument's processing time the first samples are cut off and no signal is outputted. After elapsing of the internal processing time, the output signal is synchronous to the trigger event.

**"Off"**

The signal output begins after elapsing of the processing time and starts with sample 0, i.e. the complete signal is outputted.

This mode is recommended for triggering of short signal sequences with signal duration comparable with the processing time of the instrument.

Remote command:

`[:SOURce<hw>] :BB:DVB:TRIGger:EXTernal:SYNChronize:OUTPut`
on page 61

Trigger Delay

Delays the trigger event of the signal from:

- The external trigger source

Use this setting to:

- Synchronize the instrument with the device under test (DUT) or other external devices

Remote command:

`[:SOURce<hw>] :BB:DVB:TRIGger[:EXTernal<ch>]:DELay` on page 62

Trigger Inhibit

Sets the duration for inhibiting a new trigger event subsequent to triggering. The input is to be expressed in samples.

In the "Retrigger" mode, every trigger signal causes signal generation to restart. This restart is inhibited for the specified number of samples.

This parameter is only available on external triggering.

Remote command:

`[:SOURce<hw>] :BB:DVB:TRIGger[:EXTernal<ch>]:INHibit` on page 62

4.9.2 Marker Mode

The marker output signal for synchronizing external instruments is configured in the marker settings section "Marker Mode".

The R&S SMBV supports only two markers.

Marker Mode

Selects a marker signal for the associated MARKER output.

"Restart"	A marker signal is generated at the start of every sequence length loop.
"Super Frame Start"	A marker signal is generated at the start of every super-frame period.
"Frame Start"	A marker signal is generated at the start of each frame.
"Pulse"	A regular marker signal is generated. The pulse frequency is defined by entering a divider. The frequency is derived by dividing the sample rate by the divider. The input box for the divider opens when "Pulse" is selected, and the resulting pulse frequency is displayed below it.

Remote command:

`[:SOURce<hw>] :BB:DVB:TRIGger:OUTPut<ch>:PULSe:DIVider` on page 65

`[:SOURce<hw>] :BB:DVB:TRIGger:OUTPut<ch>:PULSe:FREQuency?`

on page 65

"Pattern" A marker signal that is defined by a bit pattern is generated. The pattern has a maximum length of 64 bits and is defined in an input field which opens when pattern is selected.

Remote command:

[\[:SOURce<hw>\]:BB:DVB:TRIGger:OUTPut<ch>:PATtern](#) on page 65

"ON/OFF Period" A regular marker signal that is defined by an ON/OFF ratio is generated. A period lasts one ON and OFF cycle.
The "ON Time" and "OFF Time" are each expressed as a number of samples and are set in an input field which opens when ON/OFF ratio is selected.

Remote command:

[\[:SOURce<hw>\]:BB:DVB:TRIGger:OUTPut<ch>:ONTime](#) on page 64

[\[:SOURce<hw>\]:BB:DVB:TRIGger:OUTPut<ch>:OFFTime](#) on page 64

Remote command:

[\[:SOURce<hw>\]:BB:DVB:TRIGger:OUTPut<ch>:MODE](#) on page 64

4.9.3 Marker Delay

The delay of the signals on the MARKER outputs is set in the "Marker Delay" section.

The R&S SMBV supports only two markers.

Marker x Delay

Enters the delay between the marker signal at the marker outputs and the start of the frame or slot.

The input is expressed as a number of samples. If the setting "Fix marker delay to dynamic range" is enabled, the setting range is restricted to the dynamic range. In this range the delay of the marker signals can be set without restarting the marker and signal.

Remote command:

[\[:SOURce<hw>\]:BB:DVB:TRIGger:OUTPut<ch>:DELay](#) on page 66

Current Range without Recalculation

Displays the dynamic range within which the delay of the marker signals can be set without restarting the marker and signal.

The delay can be defined by moving the setting mark.

Remote command:

[\[:SOURce<hw>\]:BB:DVB:TRIGger:OUTPut<ch>:DELay:MINimum?](#) on page 66

[\[:SOURce<hw>\]:BB:DVB:TRIGger:OUTPut<ch>:DELay:MAXimum?](#) on page 66

Fix marker delay to current range

Restricts the marker delay setting range to the dynamic range. In this range the delay can be set without restarting the marker and signal.

Remote command:

[**:SOURce<hw>]:BB:DVB:TRIGger:OUTPut:DELy:FIXed** on page 66

4.9.4 Clock Settings

The clock settings are used to set the clock source and a delay if required.

Sync. Mode

(for R&S SMBV only)

Selects the synchronization mode.

This parameter is used to enable generation of very precise synchronous signal of several connected R&S SMBVs.

Note: If several instruments are connected, the connecting cables from the master instrument to the slave one and between each two consecutive slave instruments must have the same length and type.

Avoid unnecessary cable length and branching points.

"None" The instrument is working in stand-alone mode.

"Sync. Master" The instrument provides all connected instrument with its synchronisation (including the trigger signal) and reference clock signal.

"Sync. Slave" The instrument receives the synchronisation and reference clock signal from another instrument working in a master mode.

Remote command:

[**:SOURce<hw>]:BB:DVB:CLOCK:SYNChronization:MODE** on page 67

Set Synchronization Settings

(for R&S SMBV only)

Performs automatically adjustment of the instrument's settings required for the synchronization mode, selected with the parameter "Synchronization Mode".

Remote command:

[**:SOURce<hw>]:BB:DVB:CLOCK:SYNChronization:EXECute** on page 68

Clock Source

Selects the clock source.

"Internal" The internal clock reference is used to generate the sample clock.

"External" The external clock reference is fed in as the sample clock or multiple thereof via the CLOCK connector.

The sample rate must be correctly set to an accuracy of +/- 2 % (see data sheet).

The polarity of the clock input can be changed with the aid of "Global Trigger/Clock Settings".

Remote command:

[**:SOURce<hw>]:BB:DVB:CLOCK:SOURCE** on page 67

Clock Mode

Enters the type of externally supplied clock.

"Sample" A sample clock is supplied via the CLOCK connector.

"Multiple Sample" A multiple of the sample clock is supplied via the CLOCK connector; the sample clock is derived internally from this.

Remote command:

[**:SOURce<hw>**] [**:BB:DVB:CLOCK:MODE** on page 67

Clock Multiplier

Enters the multiplication factor for clock type "Multiple".

Remote command:

[**:SOURce<hw>**] [**:BB:DVB:CLOCK:MULTiplier** on page 67

Measured External Clock

Provided for permanent monitoring of the enabled and externally supplied clock signal.

Remote command:

CLOCK:INPut:FREQuency?

4.9.5 Global Settings

This section provides access general trigger, clock and mapping settings.

Global Trigger/Clock Settings

Accesses the "Global Trigger/Clock/Input Settings" dialog.

This dialog is to set the trigger threshold, the input impedance and the polarity of the clock and trigger inputs.

The parameters in this dialog affect all digital modulations and standards, and are described in chapter "Global Trigger/Clock/Input Settings" in the operating manual.

5 Remote-control commands

The following commands are required to perform signal generation with the DVB options in a remote environment. We assume that the R&S SMBV has already been set up for remote operation in a network as described in the R&S SMBV documentation. A knowledge about the remote control operation and the SCPI command syntax are assumed.

Conventions used in SCPI command descriptions

For a description of the conventions used in the remote command descriptions, see section "Remote Control Commands" in the R&S SMBV operating manual.

Common suffixes

The following common suffixes are used in remote commands:

Suffix	Value range	Description
SOURce<hw>	1	available baseband signals
OUTPut<ch>	1 .. 2	available markers R&S SMBV supports two markers
EXTernal<ch>	1	external trigger connectors

Programming examples

This description provides simple programming examples. The purpose of the examples is to present **all** commands for a given task. In real applications, one would rather reduce the examples to an appropriate subset of commands.

The programming examples have been tested with a software tool which provides an environment for the development and execution of remote tests. To keep the example as simple as possible, only the "clean" SCPI syntax elements are reported. Non-executable command lines (e.g. comments) start with two // characters.

At the beginning of the most remote control program, an instrument (p)reset is recommended to set the instrument to a definite state. The commands *RST and SYSTem:PRESet are equivalent for this purpose. *CLS also resets the status registers and clears the output buffer.
