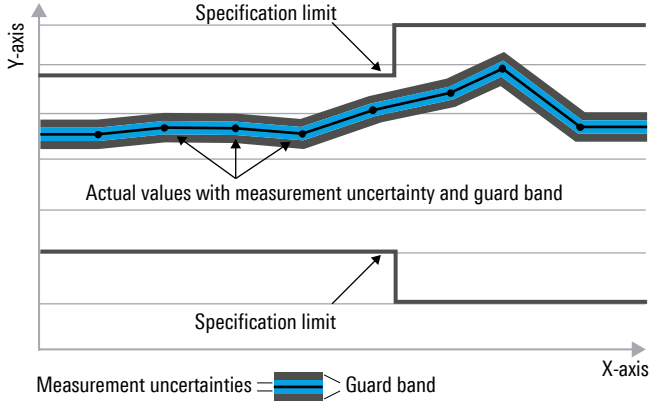
Definitions

General
Product data applies under the following conditions:

- 3 hours storage at ambient temperature followed by 1 hour warm-up operation for all measurements with the exception of tuned RF level, where warm-up time is 4 hours
- Specified environmental conditions met
- Recommended calibration interval adhered to
- All internal automatic adjustments performed, if applicable

Specifications with limits
Represent warranted product performance by means of a range of values for the specified parameter. These specifications are marked with limiting symbols such as <, ≤, >, ≥, ±, or descriptions such as maximum, limit of, minimum. Compliance is ensured by testing or is derived from the design. Test limits are narrowed by guard bands to take into account measurement uncertainties, drift and aging, if applicable.



Non-traceable specifications with limits (n. trc.)
Represent product performance that is specified and tested as described under “Specifications with limits” above. However, product performance in this case cannot be warranted due to the lack of measuring equipment traceable to national metrology standards. In this case, measurements are referenced to standards used in the Rohde & Schwarz laboratories.

Specifications without limits
Represent warranted product performance for the specified parameter. These specifications are not specially marked and represent values with no or negligible deviations from the given value (e.g. dimensions or resolution of a setting parameter). Compliance is ensured by design.

Typical data (typ.)
Characterizes product performance by means of representative information for the given parameter. When marked with <, > or as a range, it represents the performance met by approximately 80 % of the instruments at production time. Otherwise, it represents the mean value.

Nominal values (nom.)
Characterize product performance by means of a representative value for the given parameter (e.g. nominal impedance). In contrast to typical data, a statistical evaluation does not take place and the parameter is not tested during production.

Measured values (meas.)
Characterize expected product performance by means of measurement results gained from individual samples.

Uncertainties
Represent limits of measurement uncertainty for a given measurand. Uncertainty is defined with a coverage factor of 2 and has been calculated in line with the rules of the Guide to the Expression of Uncertainty in Measurement (GUM), taking into account environmental conditions, aging, wear and tear.

Device settings and GUI parameters are designated with the format “parameter: value”.

Non-traceable specifications with limits, typical data as well as nominal and measured values are not warranted by Rohde & Schwarz.

In line with the 3GPP standard, chip rates are specified in million chips per second (Mcps), whereas bit rates and symbol rates are specified in billion bit per second (Gbps), million bit per second (Mbps), thousand bit per second (kbps), million symbols per second (Msps) or thousand symbols per second (ksps), and sample rates are specified in million samples per second (Msample/s). Gbps, Mcps, Mbps, Msps, kbps, ksps and Msample/s are not SI units.

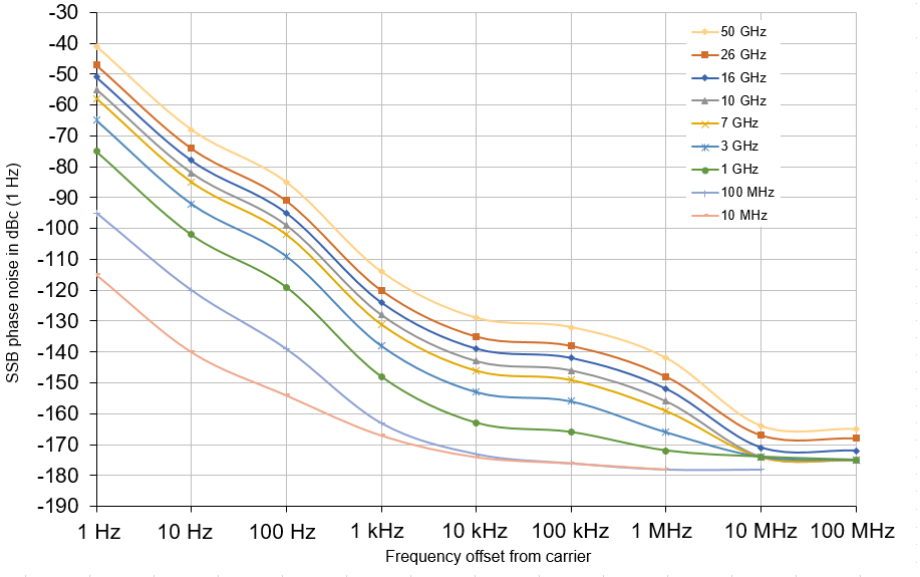
Improvement of phase noise sensitivity by number of correlations (with R&S®FSMR3-B60 option)				
	Correlations, offset frequencies ≥ 1 Hz [23]			
	10	**100**	**1000**	**10 000**
Improvement	5 dB	10 dB	15 dB	20 dB



Typical phase noise sensitivity with R&S®FSMR3-B60 and R&S®FSMR3-B4 options (start offset = 1 Hz, correlation factor = 1, signal level = 10 dBm)

[22] For signal levels below 10 dBm the broadband noise floor is limited to nominal (–172 dBm – (signal level in dBm)) dBc (1 Hz), whereas the close in phase noise is not affected. Example: with a signal level of –10 dBm the nominal broadband noise floor is –162 dBc (1 Hz).

[23] For offset frequencies below 1 Hz the improvement impact of correlation is limited by the coupling between the two R&S®FSMR3000 local oscillators. The improvement achievable in this case ranges from 15 dB (nom.) at 0.1 Hz frequency offset to 3 dB (nom.) at a frequency offset ≤ 30 mHz.

Measurement speed, nominal values

Auto freq = off, correlation factor set to ≥ 10, measurement times normalized to correlation factor = 1			
Span	**Bandwidth in % of offset**		
	30 %	**10 %**	**3 %**
1 Hz to 1 MHz	7 s	8 s	25 s
1 kHz to 1 MHz	0.03 s	0.04 s	0.07 s

To obtain the measurement time for a given number of correlations (without automatic signal frequency search), multiply the above figures by the number of correlations.

R&S®FSMR3-B65 LO inputs for residual phase noise measurements

With the R&S®FSMR3-B65 option, the R&S®FSMR3000 provides two auxiliary LO inputs to support the use of external signal sources. This allows residual phase noise measurements with two or three DUTs frequency translating or non-frequency translating.
